

Resize the Storage Tiers

Extend the individual storage tiers (SSD and HDD) within the virtual disk using the `Resize-StorageTier` cmdlet. This will automatically resize the virtual disk as well.

- Get the names of the storage tiers associated with your virtual disk:
powershell

```
$VirtualDiskName = "<Your_VirtualDisk_FriendlyName>"  
Get-VirtualDisk -FriendlyName $VirtualDiskName | Get-StorageTier |  
Select-Object FriendlyName
```

- Resize each tier to the desired new size (ensure you have enough physical capacity of each media type in the pool):
powershell

```
Resize-StorageTier -FriendlyName "<SSD_Tier_FriendlyName>" -Size  
<New_Size_Bytes>  
Resize-StorageTier -FriendlyName "<HDD_Tier_FriendlyName>" -Size  
<New_Size_Bytes>
```

For example:

powershell

```
Resize-StorageTier -FriendlyName "Vdisk01_Microsoft_HDD_Template" -  
Size 16.1TB
```
