

git clear cache

 [google.com/search](https://www.google.com/search)

3. Remove all files from the Git cache (useful for .gitignore issues):

Code

```
git rm -r --cached .  
git add .  
git commit -m "Cleared Git cache and re-indexed files"
```

Important considerations:

- `--cached` option:

This option is crucial as it tells Git to remove the files only from the staging area, not from your local filesystem.

- After using `git rm --cached`, you need to commit the changes to reflect the removal of files from Git's tracking history.
