

RDP connection won't use the saved credentials for certain remote computers

 superuser.com/questions/1693095/rdp-connection-wont-use-the-saved-credentials-for-certain-remote-computers

I'm running Windows 10 and I'm trying to access a different Windows 10 machine via RDP. I saved the RDP file to include saving the credentials. Unfortunately for some machines this does not work. The username gets saved correctly but when I start the connection the first time without entering the credentials the login fails.

A login prompt is shown instead with the correct domain/username, with the error message that the login attempt failed. If I put in the password now the RDP connection is established correctly. Deleting the saved user credentials and trying to save them again results in the same problem. Even if I activate the check box "saved credentials", the next time I try to, it's back to the same problem.

Go to **Control Panel** -> **Credential Manager** on the *local* computer you are trying to connect **from**.

You will see three sections:

1. Windows Credentials
2. Certificate-Based Credentials
3. Generic Credentials

Remove the credentials from **Windows Credentials** and add it to **Generic Credentials**.
